Enterprise Technology Strategy & Architecture Assessment

Cloud Modernization, Platform Resiliency, and Data Governance Baseline

DOCUMENT ID	EVALUATION PERIOD	PREPARED BY	REVIEW STATUS
EAC-STRAT-2026-04	FY2026 Q3–Q4	Office of the Enterprise Architect	Approved for Executive Review

1. EXECUTIVE SUMMARY

Strategic Mandate: Over the past 24 months, distributed growth and hybrid system acquisitions have increased core platform operational overhead by 28%. This assessment outlines the technical baseline, identified technical debt, and prioritizes architectural modernization initiatives across infrastructure, data integration, and compliance governance to enable scalable operations across all global business units.

2. ARCHITECTURE DOMAIN EVALUATION MATRIX

Domain	Current State Assessment	Target Target State	Priority
Core Infrastructure	Fragmented on-premises virtualization clusters with heterogeneous hypervisors and variable patch currency.	Unified Infrastructure as Code (IaC) across multi-region hybrid clouds.	**Critical (Q1)**
Data Engineering & Pipeline	Point-to-point batch ETL pipelines with point-in-time synchronization and localized data warehouses.	Event-driven event mesh with centralized enterprise data catalog and governance.	**High (Q2)**
Identity & Access (IAM)	Siloed directory services across legacy business units; periodic manual entitlement audits.	Centralized Zero-Trust architecture with role-based access control and MFA enforcement.	**Critical (Immediate)**
Integration & APIs	Mixed REST, SOAP, and proprietary interfaces with inconsistent rate limiting and monitoring.	Governed enterprise API gateway with comprehensive telemetry and automated contracts.	**Medium (Q3)**

3. STRATEGIC EXECUTION PILLARS

- **Pillar I: Zero-Trust Foundation & Boundary Enforcement:** Consolidate authentication providers into a federated directory service. Mandate cryptographic identity validation across intra-service communications and eliminate persistent network perimeter trusts.
- **Pillar II: Standardized Containerized Runtime Platforms:** Migrate monolithic core transactional services to managed Kubernetes clusters. Establish standardized deployment pipelines using immutable build artifacts and automated security scanning.
- **Pillar III: Enterprise Data Federation & Compliance Assurance:** Deploy an enterprise-grade schema registry and lineage tracker to maintain continuous compliance with international data privacy regulations and internal retention policies.

4. GOVERNANCE, RISK, AND MITIGATION FRAMEWORK

Identified Risk	Severity	Mitigation Control	Owner
Legacy Database Latency during Cloud Cutover	**High**	Deploy dual-write replication topologies with phased traffic shadowing prior to decommissioning.	Database Engineering
Inter-Service Dependency Drifts	**Medium**	Enforce automated contract tests and semantic versioning gates in deployment pipelines.	Platform Operations
Operational Knowledge Gaps in Cloud Tooling	**Medium**	Execute mandatory certification enablement tracks and implement paired rotations with enablement leads.	DevOps COE
